

PyratineXR® is in fact, Kinerase's successor; Pyratine® is an advanced cytokinin (Kinerase is a cytokinin). Clinical trials show that the Pyratine® active is significantly more effective and faster acting than Kinerase.

You should know that the Kinerase active is our Intellectual Property; we developed it for Valeant Pharma and we still own the Intellectual Property. You would find that the Pyratine® molecule actually contains the Kinerase active with a pyranyl group in the ninth position which makes it more biologically active – researchers have dubbed it the Super Kinetin.

Upon my return to the office next week, I will send you the comparative studies that were done on Pyratine* and Kinerase at the Department of Dermatology, University of California, Irvine. The investigators found that Pyratine® was faster acting and more effective. We developed all of the formulations for Kinerase and our crème is the foundation of the Kinerase product line.

Thank you for your support!

Kindest Regards,

Frank
